

WAYS TO LINK CSS TO HTML DOCUMENT

1. Inline CSS

Use the style attribute to directly insert CSS styles within the HTML element.

While this approach might be helpful for making fast style adjustments, it can also complicate the maintenance of your HTML code for larger projects.

```
<p style="color: blue; font-size: 18px;">This is a paragraph with inline styles.</p>
```

2. Internal CSS

Put CSS rules into an HTML document's <head> section as a <style> element.

For small to medium-sized projects, where every style is defined in a single file, this approach works well.

```
<!DOCTYPE html>
<html>
<head>
  <title>My Website</title>
  <style>
    p {
      color: blue;
      font-size: 18px;
    }
  </style>
</head>
```
